

Part E — Validate Business Findings

Finding	Original Premise	Week 3 Validation	Business Impact	Verdict
1. Digital Channel Volume	Digital channels drive growth based on high gross volume.	SQL CTEs show digital channels have disproportionately high fraud flags and transaction failures.	High gross volume conceals fraud losses and lowers net settled revenue.	Needs Revision (Focus on Net Settled Volume)
2. Customer Lifetime Value (CLV)	High transaction frequency automatically equals high CLV.	SQL window functions (NTILE, DENSE_RANK) and RFM clustering show many high-volume users are dormant or high-risk.	Static demographics misallocate retention spending to inactive or risky accounts.	Needs Revision (Base CLV on RFM & net margin)
3. MTD/YTD Revenue Growth	Overall MTD/YTD revenue growth shows stable baseline performance.	Star Schema DAX time-intelligence models reveal hidden regional revenue dips and KPI spikes.	Aggregated stability creates a false sense of security regarding underlying volatility.	Needs Revision (Highlight regional/channel variance)
4. Risk Review Flag Distribution	Fraud flags occur uniformly across all customer cohorts.	Multi-dimensional SQL joins reveal flags concentrate in specific onboarding cohorts and channels.	Broad fraud controls fail; mitigation must target specific vulnerable cohorts.	Needs Revision (Acknowledge cohort risk concentration)
5. Channel Efficiency Drivers	Channel efficiency is driven purely by processing	DAX efficiency measures show low-cost channels incur	Raw speed/cost metrics ignore secondary risk	Needs Revision (Use risk-adjusted
