

Week 3 Documentation

1. **Checked the Findings:** We double-checked the early conclusions from Week 2 using advanced SQL queries and discovered that high transaction volume in digital channels hid fraud risks and that high-volume users aren't always high-value users.
2. **Cleaned & Tested the Data:** We ran checks in Python and SQL to make sure there were zero missing values and that all the calculations added up correctly.
3. **Grouped Customers (RFM):** We used Python to group customers by how recently, how often, and how much money they spent to catch inactive or high-risk accounts.
4. **Built Better Dashboards:** We upgraded the Power BI data model into a Star Schema and created smart DAX formulas to track monthly/yearly revenue and regional sales accurately.
5. **Made Smart Business Recommendations:** We gave 5 clear recommendations on how to reduce fraud, keep top customers, and focus on actual net profit instead of just gross sales numbers.
